

What it is

Condition monitoring helps you catch failures early so you plan repairs instead of firefighting. It turns 'we did not see it coming' into 'we scheduled it.'

What we monitor

- Motors, pumps, fans, gearboxes, conveyors (critical assets)
- Vibration signatures (bearing wear, imbalance, misalignment)
- Temperature trends (overheating, lubrication issues)
- Electrical health (overload patterns, nuisance trips, unstable power)

What you get

- Priority asset list with baselines and thresholds
- Alerts that mean something (no spam)
- Short reports with clear recommendations and next actions
- Optional reliability assessment to set the plan

Best fit for

- Plants with repeat failures and chronic nuisance trips
- High-uptime operations where downtime is expensive
- Teams that want fewer surprises and better planning

Next step

Schedule a reliability and monitoring assessment or request support.

Call/Text: (870) 806-2555 | Web: futureautomationllc.com/request-support.html

Step 1 - Identify the pain

- Review repeat failures, downtime patterns, and parts-room usage.
- Pick the assets that hurt the most when they stop.

Step 2 - Baseline and set thresholds

- Establish baseline readings (vibration/temperature/electrical) where it matters.
- Define thresholds that trigger action - not noise.

Step 3 - Deliver a plan your team can use

- Priority list with why behind it.
- Quick wins + longer-term reliability actions.
- Documentation for maintenance and operations.

Book it

Use the support form and choose 'Condition Monitoring' or 'General'.
